

CANDELABRO SERIES CS

These types of support are more complete than the poles previously described. They have a cylindrical cabin where the apparatus is contained forming the base and at the summit a small platform to facilitate maintenance operation, which is reached by an external ladder.

The bottom half of the ladder is removable to prevent unauthorized access and can be kept in the cabin.

The height can vary from 5 to 8 meters while the other dimensions are fixed.

Each candelabro is composed of 3 parts plus foundation reinforcement and assembled at the moment of installation by means of a small crane.

They have a hot galvanized finish with epoxy paint coating.
